Contract creation approach

raj@acloudfan.com
<http://www.acloudfan.com>

Contract
Last

API Developer

```
public class OrderController : StoreController
{
    public OrderController(SalesService salesService,
        IService.IAuthService authService,
        IService.IAccountService accountService,
        IService.IEmailService emailService,
        IService.IDocumentService documentService,
        IService.IAuthService authService,
        IService.IAddressService addressService,
        IService.ICryptoService cryptoService,
        IService.IImageService imageService)
    {
        this.salesService = salesService;
        this.authService = authService;
        this.accountService = accountService;
        this.emailService = emailService;
        this.documentService = documentService;
        this.authService = authService;
        this.cryptoService = cryptoService;
        this.addressService = addressService;
    }
}
```

Contract
First

API Developer

```
public class OrderController : StoreController
{
    public OrderController(SalesService salesService,
        IService.IAuthService authService,
        IService.IAccountService accountService,
        IService.IEmailService emailService,
        IService.IDocumentService documentService,
        IService.IAuthService authService,
        IService.IAddressService addressService,
        IService.ICryptoService cryptoService,
        IService.IImageService imageService)
    {
        this.salesService = salesService;
        this.authService = authService;
        this.accountService = accountService;
        this.emailService = emailService;
        this.documentService = documentService;
        this.authService = authService;
        this.cryptoService = cryptoService;
        this.addressService = addressService;
    }
}
```

Adopt the Contract First approach for REST API design & development

Swagger 2.0 Specification

Developer documentation

Automated Proxy Creation

Server code generation

Client code generation

```
public class OrderController : StoreController
{
    public OrderController(
        ISalesService salesService,
        ICartService cartService,
        IAccountService accountService,
        IOrderService orderService,
        IDocumentService documentService,
        ICashierService cashierService,
        IAddressService addressService,
        ICryptoService cryptoService,
        IEventService eventService)
    {
        this.SalesService = salesService;
        this.CartService = cartService;
        this.AccountService = accountService;
        this.OrderService = orderService;
        this.DocumentService = documentService;
        this.CashierService = cashierService;
        this.AddressService = addressService;
        this.CryptoService = cryptoService;
        this.EventService = eventService;
    }
}
```
